
SPS/fibreFORM Modular Cabinet Enclosures...Panel/Post Connection

SPS fibre FORM vacuum formed panels are assembled with pultrusion formed FRP post sections using stainless steel rivets and a RTV silicone seal to provide a high strength connection. Calculated strength of a joint is 4500# and SPS has tested to 4000# actual. Wall sections up to 50 feet in length and depth and up to 20 feet in height, along with a variety of roof and floor base types, make for a truly modular cabinet protection system that is able to accommodate a complete range of installation and protection requirements.
